Summary

- Introduction
- 2 Definition
- Region of Convergence
- 4 z-Transform Properties
- 5 Constant-Coefficient Difference Equations

Laplace transfrom

- The Z-transform is the principal analytical tool for single-input single-output discrete-time systems.
- It is analogous to the Laplace transform for continuous systems.

The Laplace transform is defined as:

$$\mathcal{L}\{x(t)\} = F(s) = \int_0^\infty x(t)e^{-st}, \qquad (1)$$

$$\mathcal{L}\{\dot{x}(t)\} = s F(s) \tag{2}$$

Eq. 2 enables us to find the transfer function of a linear continuous time system, given the differential equation description of that system.

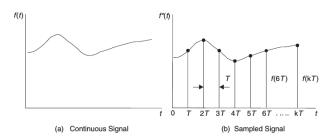

Bilateral Z-transform

The bilateral or two-sided Z-transform of a discrete-time signal x[n] is the formal power series X(z) defined as

$$\mathcal{Z}\{x[n]\} = X(z) = \sum_{n=-\infty}^{\infty} x[n]z^{-n}.$$
(3)

where x[n] is the sampled version of x(t), n is an integer and z is, in general, a complex number:

$$z = r e^{j\omega} = r \cdot (\cos \omega + j \sin \omega). \tag{4}$$

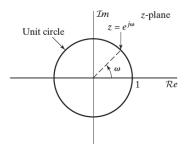

Unilateral Z-transform

Alternatively, in cases where x[n] is defined only for $n \ge 0$ the single-sided or unilateral Z-transform is defined as,

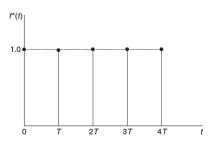

$$\mathcal{Z}\{x[n]\} = X(z) = \sum_{n=0}^{\infty} x[n]z^{-n}.$$
 (5)

$$z = r e^{j\omega} = r \cdot (\cos \omega + j \sin \omega).$$

Example

Find the z-transform of the unit step function u(t) = 1.

$$\mathcal{Z}\lbrace u[n]\rbrace = U(z) = \sum_{n=0}^{\infty} u(kT)z^{-n}, \qquad (6)$$

$$U(z) = z^{0} + z^{-1} + z^{-2} + z^{-3} + \dots + z^{-n} + \dots$$
 (7)

Equation 7 can be written in closed-form as,

$$\mathcal{Z}\{u[n]\} = \frac{z}{z-1} = \frac{1}{1-z^{-1}}.$$
 (8)

Region of Convergence

The region of convergence (ROC) is the set of points in the complex plane for which the Z-transform summation converges.

$$ROC = \left\{ z : \left| \sum_{n = -\infty}^{\infty} x[n] z^{-n} \right| < \infty \right\}.$$
 (9)

Example (no ROC)

Let
$$x[n] = 0.5^n = \{\cdots, 0.5^{-3}, 0.5^{-2}, 0.5^{-1}, 1, 0.5, 0.5^2, \cdots\} \Rightarrow$$

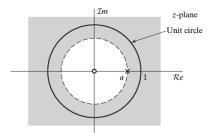

$$\sum_{n=-\infty}^{\infty} x[n]z^{-n} \to \infty$$

Therefore, there are no values of z that satisfy this condition.

Causal ROC

Let
$$x[n] = 0.5^n u[n] = \{\cdots, 0, 0, 0, 1, 0.5, 0.5^2, 0.5^3, \cdots\}.$$

$$\sum_{n=-\infty}^{\infty} \left(0.5^n u[n]\right) z^{-n} = \sum_{n=0}^{\infty} 0.5^n z^{-n} = \sum_{n=0}^{\infty} \left(\frac{0.5}{z}\right)^n = \frac{1}{1 - 0.5 z^{-1}} < \infty$$

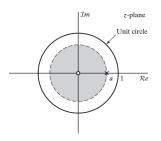

Using infinite geometric series, the equality only holds if $|0.5 z^{-1}| < 1$, which can be rewritten in terms of z as |z| > 0.5. Thus, the ROC is |z| > 0.5, the region **outside** a circle of radius 0.5. Generally, there will be one zero at z = 0, and one pole at z = a.

Anti causal ROC

Let
$$x[n] = -0.5^n u[-n-1] = {\cdots, -0.5^{-3}, -0.5^{-2}, -0.5^{-1}, 0, 0, 0, \cdots}.$$

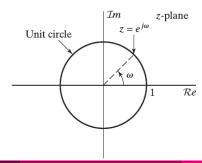

$$\sum_{n=-\infty}^{\infty} x[n]z^{-n} = -\sum_{n=-\infty}^{-1} 0.5^n z^{-n} = -\sum_{n=1}^{\infty} \left(0.5^{-1}z\right)^n = -\sum_{n=0}^{\infty} \left(0.5^{-1}z\right)^n - 1$$
$$= -\frac{1}{1 - 0.5^{-1}z} + 1 = \frac{1}{1 - 0.5z^{-1}} < \infty$$

Using infinite geometric series, the equality only holds if $|0.5 z^{-1}| > 1$, which can be rewritten in terms of z as |z| < 0.5. Thus, the ROC is |z| < 0.5, the region **inside** a circle of radius 0.5. This is intentional to demonstrate that the transform result alone is insufficient.

Stability, Causality, and the ROC

- Z-transform X(z) of x[n] is unique when and only when specifying the ROC.
- The stability of a system can also be determined by knowing the ROC alone.
- If the ROC contains the unit circle (i.e., |z| = 1) then the system is stable.
- If a system is causal, then the ROC must contain infinity and the system function will be a right-sided sequence.
- If both stability and causality are needed, all the poles of the system function must be inside the unit circle.

Common z-transform pairs

Sequence	Transform	ROC
1. δ[n]	1	All z
2. <i>u</i> [<i>n</i>]	$\frac{1}{1-z^{-1}}$	z > 1
3. $-u[-n-1]$	$\frac{1}{1-z^{-1}}$	z < 1
4. $\delta[n-m]$	z^{-m}	All z except 0 (if $m > 0$) or ∞ (if $m < 0$)
5. $a^n u[n]$	$\frac{1}{1 - az^{-1}}$	z > a
$6a^n u[-n-1]$	$\frac{1}{1 - az^{-1}}$	z < a
7. $na^nu[n]$	$\frac{az^{-1}}{(1-az^{-1})^2}$	z > a
$8na^nu[-n-1]$	$\frac{az^{-1}}{(1-az^{-1})^2}$	z < a
9. $\cos(\omega_0 n)u[n]$	$\frac{1 - \cos(\omega_0)z^{-1}}{1 - 2\cos(\omega_0)z^{-1} + z^{-2}}$	z > 1
10. $\sin(\omega_0 n)u[n]$	$\frac{\sin(\omega_0)z^{-1}}{1 - 2\cos(\omega_0)z^{-1} + z^{-2}}$	z > 1
11. $r^n \cos(\omega_0 n) u[n]$	$\frac{1 - r\cos(\omega_0)z^{-1}}{1 - 2r\cos(\omega_0)z^{-1} + r^2z^{-2}}$	z > r
12. $r^n \sin(\omega_0 n) u[n]$	$\frac{r\sin(\omega_0)z^{-1}}{1 - 2r\cos(\omega_0)z^{-1} + r^2z^{-2}}$	z > r
13. $\begin{cases} a^n, & 0 \le n \le N - 1, \\ 0, & \text{otherwise} \end{cases}$	$\frac{1 - a^N z^{-N}}{1 - a z^{-1}}$	z > 0

Properties: Linearity

The z-transform of $x[n] = a_1x_1[n] + a_2x_2[n]$ is,

$$X(z) = \sum_{n=-\infty}^{\infty} (a_1 x_1[n] + a_2 x_2[n]) z^{-n}, \qquad (10)$$

$$=a_1\sum_{n=-\infty}^{\infty}x_1[n]z^{-n}+a_2\sum_{n=-\infty}^{\infty}x_2[n]z^{-n},$$
 (11)

$$= a_1 X_1(z) + a_2 X_2(z). (12)$$

Properties: Shift in time

The z-transform of $x[n-n_0]$ is,

$$X(x[n-n_0]) = \sum_{n=-\infty}^{\infty} x[n-n_0]z^{-n}.$$
 (13)

Let $m = n - n_0$,

$$X(x[n-n_0]) = \sum_{m=-\infty}^{\infty} x[m]z^{-(m+n_0)}, \qquad (14)$$

$$=z^{-n_0}\sum_{m=-\infty}^{\infty}x[m]z^{-m},$$
 (15)

$$=z^{-n_0}X(z). (16)$$

This leads directly to a property analogous to Eq. 2,

$$\mathcal{Z}\{x[n-1]\} = z^{-1} X(z). \tag{17}$$

Properties: Convolution

The z-transform of

$$x[n] = x_1[n] * x_2[n] = \sum_{k=-\infty}^{\infty} x_1[k] x_2[n-k],$$
 (18)

is.

$$X(z) = \sum_{n=-\infty}^{\infty} \left[\sum_{k=-\infty}^{\infty} x_1[k] x_2[n-k] \right] z^{-n},$$
 (19)

$$= \sum_{k=-\infty}^{\infty} x_1[k] \sum_{n=-\infty}^{\infty} x_2[n-k]z^{-n}, \qquad (20)$$

Let m = n - k

$$X(z) = \sum_{k=-\infty}^{\infty} x_1[k] \sum_{m=-\infty}^{\infty} x_2[m] z^{-(m+k)},$$
 (21)

$$= \sum_{k=-\infty}^{\infty} x_1[k] z^{-k} \sum_{m=-\infty}^{\infty} x_2[m] z^{-m}, \qquad (22)$$

$$= X_1(z) X_2(z). (23)$$

Constant-Coefficient Difference Equations

Consider a system described by the linear constant-coefficient difference equation,

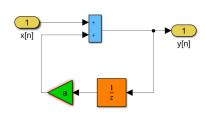

$$y[n] = x[n] + ay[n-1],$$
 (24)

$$y[n] - ay[n-1] = x[n],$$
 (25)

$$Y(z) - a Y(z) z^{-1} = X(z),$$
 (26)

$$Y(z)(1-az^{-1})=X(z),$$
 (27)

$$H(z) = \frac{Y(z)}{X(z)} = \frac{1}{(1 - az^{-1})}$$
(28)

In general,

$$\sum_{k=0}^{N} a_k y[n-k] = \sum_{k=0}^{M} b_k x[n-k], \qquad (29)$$

$$y[n] = \sum_{k=0}^{M} b_k x[n-k] - \sum_{k=1}^{N} a_k y[n-k],$$
 (30)

$$H(z) = \frac{Y(z)}{X(z)} = \frac{b_0 + b_1 z^{-1} + b_2 z^{-2} + \dots + b_M z^{-(M)}}{1 + a_1 z^{-1} + a_2 z^{-2} + \dots + a_N z^{-(N)}}.$$
